

Natural Gas Safety Guide

Guide GS-001 · Cymbal Energy Gas Operations · For customers

Know the signs of a gas leak

- A smell like rotten eggs or sulfur. Natural gas has no smell, so we add one called mercaptan.
- A hissing, whistling or roaring sound near a gas line or appliance.
- Dead or dying plants over a gas line, bubbles in standing water, or dirt blowing into the air.

If you suspect a leak

- Leave the building immediately and take everyone with you. Leave doors open behind you.
- Do not use light switches, phones, garage door openers, or anything that could make a spark inside.
- Do not try to find the leak or shut off appliances.
- From a safe distance, call 911 and the Cymbal Energy gas emergency line at **1-800-555-0199**. It is answered 24 hours a day.
- There is never a charge for a leak investigation.

Carbon monoxide

Carbon monoxide is odorless. Install CO alarms on every level of the home and near sleeping areas. If an alarm sounds or people feel dizzy or nauseated, get everyone outside and call 911.

Portable generators after a storm

- Never run a generator indoors, in a garage, or on a porch. Keep it at least 20 feet from the house with the exhaust pointed away.
- Never plug a generator into a wall outlet. Backfeeding can kill line workers restoring your power.

Before you dig

Call 811 at least three working days before any digging project so buried gas and electric lines can be marked at no cost.
